
TRADEFLOW®

Global Trade Management System

Tradeflow is a web-based software suite designed by Expeditors for use by customers. Its solutions provide tools to help importers and exporters gain more control of the global logistics supply chain through visibility and data management. Divided into integrated modules, or Centres, Tradeflow facilitates activities such as global product classification, landed cost estimation, compliance management, electronic booking, document creation and restricted party screening.

Product Management Centre

The system is a repository to store cross-border product attributes and images and it acts as your data warehouse for crucial classification and preferential duty information. It is designed to facilitate collaboration between you and all of your global trade partners.

Online Tariff and Compliance Tools

Access the Harmonized System code for classification of any product for over 120 countries. Have visibility to trade restrictions and other barriers (quotas and anti-dumping duties). Improve Customs compliance.

Integration and Efficiency

Back-end integration (inbound and outbound) between Tradeflow and an external system serves to extend additional functionality without adding extensive manual processes. Batch processing via mass uploads and mass updates provides an efficient way to work with large amounts of product data.

Trade Partner Centre

The contact information for supply chain partners, such as suppliers and customs brokers, is stored in a repository. When also using the Product Management Centre, vendor and/or manufacturer trade partners can be linked to specific products, and optionally, be used to extend access for the trade partners to view products directly in Tradeflow.

Restricted Party Screening

Monitor restricted party screening, denied parties and embargoes entities and countries. Comply with restrictions published by the UN, EU, US and other country-specific listings.

Shipment Management Centre

This centre uses product and trade partner data for purposes of booking shipments or import/clearances, creating documents and distributing these documents and data. This system offers efficiencies to importers and exporters and their logistics providers concerned with consistent streamlined shipment processing. Collaboration is made simple by allowing access to your documents across departments, divisions, vendors and other trade partners.

Trade Reference Centre

This centre provides users with access to current regulatory data, tariff classifications, and other pertinent trade data.

Landed Cost Estimator

Gauge the duty and tax consequences for different sourcing and trading scenarios, including preferential trade agreements.

Import & Export Controls

Identifies barriers to trade including import or export license or permit requirements, quotas, anti-dumping or countervailing duties, and embargoes. Lookup controls at either a commodity or country level.

Other Global Trade Content

Trade Party Screening, Classification tools, country profiles and document forms library.
